Extra Work needed on this project

Although I was given enough time to put my solution, I would like to incorporate the below changes for ensuring a better quality project.

- Storing a unique transaction id (preferably a uuid) for every money transfer transaction happens.
- There are many String values hard coded in the project. I would rather use a properties file/constants class.
- Modularizing the packages, like
  - com.db.awmd.challenge.service → com.db.awmd.challenge.accounts.service and com.db.awmd.challenge.transfers.service
- Some endpoints like are not returning any value (the account creation POST method). These messages also needs to be returned to the client.
- Designing the exception framework in a better way.
